## Kit Contents

| Cat. No. | $341-150$ | $341-152$ |  |
| :--- | :---: | :---: | :---: |
| Type | mini |  |  |
| Components | Quantity |  |  |
| No. of preparation | 50 | 250 |  |
| Column Type P (mini) | 50 | 250 |  |
| I.5 ml microcentrifuge tube | 50 | 250 |  |
| Buffer SL | 34 ml | 160 ml |  |
| Buffer KL | 20 ml | 85 ml |  |
| Buffer BL | 15 ml | 60 ml | Room |
| Buffer RBI (concentrate)* | 5 ml | 17 ml |  |
| Buffer RBW (concentrate)* | 18 ml | 77 ml | $\left(15 \sim 25^{\circ} \mathrm{C}\right)$ |
| Buffer RNW (concentrate)* | 8 ml | 34 ml |  |
| Nuclease-free water | 15 ml | 90 ml |  |
| PK Storage buffer | 1.5 ml | 7 ml |  |
| Proteinase K ** | 24 mg | 120 mg |  |
| Protocol Handbook | 1 | 1 |  |

* Before first use, add absolute ethanol (ACS grade or better) into Buffer RBI, RBW, RNW as indicated on the bottle.
** For the long-term storage of Proteinase $K$, store at $4^{\circ} \mathrm{C}$. But after reconstitution of Proteinase K store at $-20^{\circ} \mathrm{C}$. Refer to instruction of Proteinase $K$ on page 10 .

## Materials Not Provide

- Reagent : Absolute ethanol (ACS grade or better)

Powerbead ${ }^{\text {TM }}$ tube (Protocol for Stool, Cat. No. | |4-990 [50], | |4-99 | [6]).
$30 \mathrm{mg} / \mathrm{ml}$ lysozyme (LYS702, Bioshop, Canada, or equivalent)
$300 \mu \mathrm{~g} / \mathrm{ml}$ lysostaphin (L7386, SIGMA, USA, or equivalent)
Buffer GP (I 06-900~106-905, GeneAll, Korea)

- Disposable material : RNase-free pipette tips, Disposable gloves
- Equipment : Equipment for homogenizing sample, Microcentrifuge, Vortex mixer, Suitable protector

## Product Specifications

Ribospin ${ }^{\text {TM }}$ Pathogen/TNA
\(\left.\begin{array}{l|c}\hline Type \& Spin <br>
\hline Maximum amount of starting samples \& Liquid sample : 200 \mu \mathrm{l} / \mathrm{prep} <br>
Solid sample : 20 \mathrm{mg} / \mathrm{prep} <br>

Cultured cell :5×10\%/prep\end{array}\right]\)| $\geq 30 \mathrm{~min}$ |  |
| :--- | :---: |
| Preparation time | $750 \mu \mathrm{l}$ |
| Maximum loading volume of mini column | $30 \mu \mathrm{l}$ |

## Quality Control

All components in GeneAll ${ }^{\circledR}$ Ribospin ${ }^{\text {TM }}$ Pathogen/TNA are manufactured in strictly clean condition, and its degree of cleanness is monitored periodically. Quality control is carried out thoroughly from lot to lot, and only the qualified kits are approved to be delivered.

## Storage Conditions

All components of GeneAll ${ }^{\circledR}$ Ribospin ${ }^{\top M}$ Pathogen/TNA should be stored at room temperature ( $15 \sim 25^{\circ} \mathrm{C}$ ). It should be protected from exposure to direct sunlight. During shipment or storage under cool ambient condition, a precipitate can be formed in Buffer KL and BL. In such a case, heat the bottle to $56^{\circ} \mathrm{C}$ to dissolve completely. Using precipitated buffers will lead to poor DNA/RNA recovery. GeneAll ${ }^{\circledR}$ Ribospin ${ }^{\text {TM }}$ Pathogen/TNA is guaranteed until the expiration date printed on the product box.

## Safety Information

The buffers included in GeneAll ${ }^{\oplus}$ Ribospin ${ }^{\text {TM }}$ Pathogen/TNA contain irritants which are harmful when in contact with skin or eyes, or when inhaled or swallowed. Care should be taken when handling such materials. Always wear gloves and eye protection, and follow standard safety precautions.
Buffer KL and BL contains chaotropic agents, which can form highly reactive compounds when combined with bleach.
Do NOT add bleach or acidic solutions directly to the sample-preparation waste.

## Product Disclaimer

GeneAll ${ }^{®}$ Ribospin ${ }^{\text {TM }}$ Pathogen/TNA is for research use only, not for use in diagnostic procedure.

## Preventing RNase Contamination

RNase can be introduced accidentally during RNA purification. Wear disposable gloves always, because skin often contains bacteria and molds that can be a source of RNase contamination. Use sterile, disposable plastic wares and automatic pipettes to prevent cross-contamination of RNase from shared equipment.

## Proteinase K

This kit provides Proteinase K and PK Storage buffer for dissolving Proteinase K. Reconstituted Proteinase K serves efficient viral lysis for most sample types. Proteinase K solution should be stored under $4^{\circ} \mathrm{C}$ for conservation of activity. It can be stored at $4^{\circ} \mathrm{C}$ for I year without significant decrease in activity.
To store for extended periods of time, it is recommended to store under $-20^{\circ} \mathrm{C}$.

## Product Description

The GeneAll ${ }^{\text {® }}$ Ribospin ${ }^{\text {TM }}$ Pathogen/TNA kit provides a flexible format for the purification of the Pathogen and Total Nucleic Acids (TNA) from various samples such as serum, body fluid, tissues, whole blood, bacteria, swab, stool, raw milk and virusinfected samples.

The GeneAll ${ }^{\circledR}$ Ribospin ${ }^{\text {TM }}$ Pathogen/TNA kit uses utilizes the advanced silica-binding technology to purify the total nucleic acids that become sufficiently pure for many applications. Viral samples are lysed in the optimized buffer comprising detergent and lytic enzyme. Under optimized binding conditions, nucleic acids in the lysate bind to silica membrane and impurities pass through the membranes into a collection tube.

The membranes are washed with a series of alcohol-containing buffers to remove traces of proteins, cellular debris and salts.

Finally, pure nucleic acids are released into a clean microcentrifuge tube with deionized water or low ionic strength buffer. The elute should be treated carefully because RNA are very sensitive to contaminants such as RNases, often found on general labware and dust.

Purified nucleic acids can be used directly for PCR, qPCR, RT-PCR, or any downstream application without further manipulation.

## Sample amount and expected yield

| Sample | Starting amount | Yield $(\mu \mathrm{g})$ |
| :--- | :---: | :---: |
| Cultured cell | $5 \times 10^{6}$ | $60 \sim 90$ |
| Whole blood (Human) | $200 \mu \mathrm{l}$ | $2 \sim 6$ |
| Whole blood (Pig) | $200 \mu \mathrm{l}$ | $10 \sim 20$ |
| Heart | 20 mg | $20 \sim 50$ |
| Lung | 20 mg | $80 \sim 120$ |
| Spleen | 10 mg | $100 \sim 130$ |
| Stomach | 20 mg | $60 \sim 100$ |
| Intestein | 20 mg | $100 \sim 130$ |
| Liver | 20 mg | $50 \sim 80$ |
| Kidney | 20 mg | $60 \sim 100$ |
| Brain | 20 mg | $20 \sim 50$ |
| Stool (Pig) | 50 mg | $10 \sim 30$ |
| Raw milk | 1 ml | $2 \sim 4$ |

## A. PROTOCOL FOR <br> Body fluid/Cultured cells (Rapid protocol)

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better).
into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare $1.5 \mathrm{~m} /$ microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer KL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
I. Transfer $200 \mu \mathrm{l}$ of sample to the 1.5 ml microcentrifuge tube.

## Use the starting sample listed below.

If the sample volume is less than $200 \mu \mathrm{l}$, adjust the volume to $200 \mu \mathrm{l}$ with IXPBS.

| Sample | Max. amount per prep | Preparation |
| :--- | :---: | :--- |
| Cultured cells or lymphocyte | $5 \times 10^{6}$ cells | $5 \times 10^{6}$ cells in $200 \mu \mathrm{l}$ of IXPBS |
| Body fluid | $200 \mu \mathrm{l}$ | Direct use |
| Serum | $200 \mu \mathrm{l}$ | Direct use |
| Virus in culture median | $200 \mu \mathrm{l}$ | $200 \mu \mathrm{l}$ of virus-containing media |

2. Add $\mathbf{2 0} \mu \mathrm{l}$ of Proteinase K solution ( $\mathbf{2 0} \mathrm{mg} / \mathrm{ml}$, provided) and $200 \mu \mathrm{l}$ of Buffer KL to the sample. Vortex vigorously to mix thoroughly.
3. Incubate at $\mathbf{2 0} \sim \mathbf{2 5}^{\circ} \mathrm{C}$ for $\mathbf{5} \mathbf{~ m i n}$.

Changing the incubation temperature to $56^{\circ} \mathrm{C}$ may increase the extraction efficiency of bacteria, but it is not recommended as the changed condition of lysis could not preserve the RNA integrity.
4. Add $300 \mu$ l of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
5. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for 1 mm , and discard the pass-through and reinsert the mini column back into the collection tube.
6. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
7. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
8. Centrifuge at full speed for I min and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.
9. Add $50 \mu \mathrm{l}$ of nuclease-free water to the center of the membrane in the mini column.
Incubate at room temperature for I min.
10. Centrifuge at full speed for I min.

## B. PROTOCOL FOR

## Body fluid/Cultured cells (Standard protocol)

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better). into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare 1.5 ml microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer KL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
I. Transfer $200 \mu$ l of sample to the 1.5 ml microcentrifuge tube. Use the starting sample listed below.
If the sample volume is less than $200 \mu \mathrm{l}$, adjust the volume to $200 \mu \mathrm{l}$ with IX PBS.

| Sample | Max. amount per prep | Preparation |
| :--- | :---: | :--- |
| Cultured cells or lymphocyte | $5 \times 10^{6}$ cells | $5 \times 10^{6}$ cells in $200 \mu \mathrm{I}$ of IXPBS |
| Body fluid | $200 \mu \mathrm{l}$ | Direct use |
| Serum | $200 \mu \mathrm{l}$ | Direct use |
| Virus in culture median | $200 \mu \mathrm{l}$ | $200 \mu \mathrm{l}$ of virus-containing media |
| Gram-negative bacteria | Up to $2 \times 10^{9}$ cells | $2 \times 10^{9}$ cells in $200 \mu \mathrm{l}$ of IXPBS |

2. Add $200 \mu \mathrm{l}$ of Buffer SL to the sample and vortex to mix thoroughly.
3. Add $20 \mu \mathrm{l}$ of Proteinase K solution ( $20 \mathrm{mg} / \mathrm{ml}$, provided) and $200 \mu \mathrm{l}$ of Buffer KL to the sample. Vortex vigorously to mix thoroughly.
4. Incubate at $\mathbf{2 0} \sim \mathbf{2 5}^{\circ} \mathbf{C}$ for $\mathbf{1 0} \mathbf{~ m i n}$.

Changing the incubation temperature to $56^{\circ} \mathrm{C}$ may increase the bacteria DNA recovery, but it is not recommended as the changed condition of lysis could not preserve the RNA integrity.
5. Add $300 \mu \mathrm{I}$ of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
6. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for $I \mathrm{~min}$, and discard the pass-through and reinsert the mini column back into the collection tube.
7. Repeat step 6 with the remainder of the sample.
8. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
9. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
10. Centrifuge at full speed for I min and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.
II. Add $50 \mu$ I of nuclease-free water to the center of the membrane in the mini column.
Incubate at room temperature for I min.
12. Centrifuge at full speed for I min.

## C. PROTOCOL FOR <br> Whole blood

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better).
into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare 1.5 ml microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer BL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
I. Transfer $200 \mu$ l of whole blood to the 1.5 ml microcentrifuge tube.

2. Add $200 \mu \mathrm{l}$ of Buffer SL to the sample and vortex to mix thoroughly.
3. Add $20 \mu \mathrm{l}$ of Proteinase K solution ( $20 \mathrm{mg} / \mathrm{ml}$, provided) and $200 \mu \mathrm{l}$ of Buffer BL to the sample. Vortex vigorously to mix thoroughly. Use Buffer BL instead of Buffer KL in the case of blood samples. The Buffer KL can cause blood clotting.
4. Incubate at $\mathbf{2 0} \sim \mathbf{2 5}^{\circ} \mathbf{C}$ for $\mathbf{1 0} \mathbf{~ m i n}$.

Changing the incubation temperature to $56^{\circ} \mathrm{C}$ may increase bacteria DNA recovery, but it is not recommended as changed condition of lysis could not preserve RNA integrity.
5. Add $300 \mu$ l of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
6. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for $I \mathrm{~min}$, and discard the pass-through and reinsert the mini column back into the collection tube.
7. Repeat step 6 with the remainder of the sample.
8. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
9. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
10. Centrifuge at full speed for I min and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.
II. Add $50 \mu \mathrm{I}$ of nuclease-free water to the center of the membrane in the mini column.
Incubate at room temperature for I min.
12. Centrifuge at full speed for I min.

## D. PROTOCOL FOR Tissue

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better).
into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare $1.5 \mathrm{~m} /$ microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer KL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
I. Homogenize up to $10 \sim 20 \mathrm{mg}$ of tissue as described in step I-I, I-2 or I-3, depending on the sample type.
Homogenizing the sample finely will accelerate lysis and decrease the lysis time. For spleen or stomach tissue, up to 10 mg can be processed.
- I-I For soft tissue, such as liver or brain, put up to $\mathbf{2 0} \mathbf{~ m g}$ of the tissue into 1.5 ml microcentrifuge tube (not provided), add $300 \mu \mathrm{l}$ of Buffer SL, and homogenize thoroughly with microhomogenizer.
- I-2 If microhomogenizer is not available or the tissue is not soft, grind the tissue to a fine powder with liquid nitrogen in a pre-chilled mortar and pestle. Put up to $\mathbf{2 0} \mathbf{~ m g}$ of the powdered tissue into 1.5 ml microcentrifuge tube. Add $300 \mu$ l of Buffer SL and pulse-vortex for I5 sec.
- I-3 If neither Ia nor Ib is available, mince the tissue with sharp blade or scalpel as small as possible. Put the tissue into a 1.5 ml microcentrifuge tube.
Add $300 \mu \mathrm{l}$ of Buffer SL and pulse-vortex for 15 sec.
*** Alternatively, tissue samples can be effectively homogenized using some instruments, such as a rotor-stator homogenizer or a bead-beater.

2. Incubate at room temperature for $\mathbf{5} \mathbf{~ m i n}$.
3. (Optional:) If many air bubbles form from the samples, spin down briefly within 20 sec at $13,000 \mathrm{rpm}$ to remove the bubbles and not the homogenized tissue piece.
Do not exceed 20 sec to increase extraction efficiency of bacteria, exceed 20 sec of centrifugation lead to sink bacteria.
4. Transfer $200 \mu \mathrm{I}$ of the lysate except the bubbles and piece of tissues to the new 1.5 ml microcentrifuge tube.
5. Add $20 \mu \mathrm{l}$ of Proteinase K solution ( $20 \mathrm{mg} / \mathrm{ml}$, provided) and $200 \mu \mathrm{l}$ of Buffer KL and to the tube. Vortex vigorously to mix thoroughly.
6. Incubate at room temperature for 10 min .
7. Add $300 \mu \mathrm{l}$ of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
8. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
9. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
10. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for $I \mathrm{~min}$, and discard the pass-through and reinsert the mini column back into the collection tube.

I I. Centrifuge at full speed for I min and remove residual wash buffer. Place the mini column into a fresh $\mathbf{I} .5 \mathrm{ml}$ microcentrifuge tube.
12. Add 50~200 $\mu$ I of nuclease-free water to the center of the membrane in the mini column. Incubate at room temperature for I min.
13. Centrifuge at full speed for I min.
14. Dilute the elute to $\mathbf{2 0 \sim 2 5 0} \mathbf{n g} / \boldsymbol{\mu}$ l to use the template for RT-PCR or PCR. Tissue samples usually have many cells. The total nucleic acid of cells from animal tissue can be competitors with the nucleic acid of the pathogen in PCR reactions.

## E. PROTOCOL FOR <br> Stool/Fecal swab

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better). into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare 1.5 ml microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer KL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
I. Collect the samples as described in step I-I, I-2 depending on the sample type.

## -I-I Stool

: Add up to $\mathbf{5 0} \mathbf{~ m g}$ of stool sample to a $\mathbf{I} .5 \mathbf{~ m l}$ microcentrifuge tube. To increase the extraction efficiency and purity, using a Powerbead ${ }^{T M}$ tube instead of a 1.5 ml micocentrifuge tube is recommended. The Powerbead ${ }^{\text {TM }}$ tube is not provided in this kit. The Powerbead ${ }^{\text {TM }}$ tube can be purchased separately (Cat. No. | | 4-990 [50], | | 4-99| [6]).

## I-2 Fecal swab

: Vortex fecal swab tube vigorously to mix thoroughly and transfer $200 \mu \mathrm{l}$ of the sample to a 1.5 ml microcentrifuge tube.
2. Add $600 \mu \mathrm{l}$ of Buffer SL to the tube and vortex for $\mathbf{2} \mathbf{~ m i n}$ or until the stool sample is thoroughly homogenized.
It is important to homogenize the sample thoroughly. Insufficient homogenization time and condition is related to low recovery yield.
3. Centrifuge the samples as described in step 3-I, 3-2 depending on the pathogen type.

## 3-I For extraction of virus;

Centrifuge at $13,000 \mathrm{rpm}$ for 5 min at room temperature and carefully transfer the $300 \mu$ l of supernatant to a 1.5 ml microcentrifuge tube.

## 3-2 For extraction of bacteria and nucleic acid of stool;

Centrifuge at $1,000 \mathrm{rpm}$ for 30 sec at room temperature and carefully transfer the $\mathbf{3 0 0} \boldsymbol{\mu}$ l of supernatant to a 1.5 ml microcentrifuge tube.
Centrifugation at 1,000 rpm for 30 sec is for the sinking debris of stool.
Do not exceed 30 sec to increase the extraction efficiency of bacteria, exceeding 30 sec of centrifugation can lead to sink bacteria.
4. Add $20 \mu \mathrm{l}$ of Proteinase K solution ( $20 \mathrm{mg} / \mathrm{ml}$, provided) and $300 \mu \mathrm{l}$ of Buffer KL to the sample. Vortex vigorously to mix thoroughly.
5. Incubate at $\mathbf{2 0} \sim \mathbf{2 5}{ }^{\circ} \mathrm{C}$ for $5 \mathbf{~ m i n}$.
6. Add $300 \mu$ l of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
7. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $6,000 \times \mathrm{g}$ above ( $>8,000 \mathrm{rpm}$ ) for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
8. Repeat step 7 with the remainder of the sample.
9. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.

IO. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
II. Centrifuge at full speed for I min and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.

I 2. Add $50 \sim 200 \mu$ l of nuclease-free water to the center of the membrane in the mini column. Incubate at room temperature for I min.
$P C R$ inhibitor in samples such as stool can obstruct $P C R$ reaction. Dilute the elute to use the template for $P C R$ reactions.

I3. Centrifuge at full speed for I min.

## Saliva, Nasopharyngeal aspirates, Buccal swabs

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better).
into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare 1.5 ml microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer KL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
I. Collect the samples as described in step I-I, I-2 depending on the sample type.

## - I-I Saliva

: $400 \mu \mathrm{l}$ of saliva in a 1.5 ml microcentrifuge tube. add $600 \mu \mathrm{l}$ of IX PBS to the sample and vortex until the saliva sample is thoroughly homogenized.
Collect saliva on ice and as quickly as possible or use RNA protect saliva reagent. Because the RNA in saliva is unstable and easy to degrade.

## - I-2 Nasopharyngeal aspirates

: Collect I ml of nasopharyngeal aspirates in a 1.5 ml microcentrifuge tube and vortex until the sample is thoroughly homogenized.

## - I-3 Buccal swab

: Vortex buccal swab tube vigorously to mix thoroughly and transfer $300 \mu \mathrm{l}$ of the sample to a 1.5 ml microcentrifuge tube.
2. Centrifuge the samples as described in step 2-1, 2-2 depending on the pathogen type.

## -2-I For extraction of virus;

I) Centrifuge at $13,000 \mathrm{rpm}$ for 5 min at room temperature and carefully transfer the $\mathbf{2 0 0} \mu \mathrm{l}$ of supernatant to a 1.5 ml microcentrifuge tube.
2) Add $\mathbf{2 0 0} \mu \mathrm{l}$ of Buffer SL to the sample and vortex vigorously to mix.

## -2-2 For extraction of bacteria and nucleic acid of saliva;

I) Centrifuge at $13,000 \mathrm{rpm}$ for 5 min at room temperature and carefully discard the supernatant.
2) Add $\mathbf{2 0 0} \mu \mathrm{l}$ of Buffer SL to the pellet and resuspend completely the pellets in Buffer SL.
3. Add $20 \mu \mathrm{l}$ of Proteinase K solution ( $20 \mathrm{mg} / \mathrm{ml}$, provided) and $300 \mu \mathrm{l}$ of Buffer KL to the sample. Vortex vigorously to mix thoroughly.
4. Incubate at $\mathbf{2 0} \boldsymbol{\sim} \mathbf{2 5}{ }^{\circ} \mathrm{C}$ for $5 \mathbf{m i n}$.
5. Add $300 \mu$ l of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
6. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for $I \mathrm{~min}$, and discard the pass-through and reinsert the mini column back into the collection tube.
7. Repeat step 6 with the remainder of the sample.
8. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
9. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
10. Centrifuge at full speed for I min and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.

I I. Add $50 \mu$ l of nuclease-free water to the center of the membrane in the mini column. Incubate at room temperature for I min.

I 2. Centrifuge at full speed for I min.

## G. PROTOCOL FOR <br> Raw milk

This pretreatment is for the extraction of the bacteria and the nucleic acid of raw milk. It is not suitable for virus because of the centrifugation step.

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better). into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare $1.5 \mathrm{~m} /$ microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer KL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
I. Transfer I ml of raw milk to the 1.5 ml microcentrifuge tube.

2. Centrifuge at $10,000 \times \mathrm{g}$ above for 5 min at room temperature and discard the supernatant containing fat and liquid layer.
3. Add $200 \mu \mathrm{l}$ of Buffer SL to the pellet and resuspend completely the pellets in Buffer SL.
4. Add $20 \mu \mathrm{l}$ of Proteinase K solution ( $20 \mathrm{mg} / \mathrm{ml}$, provided) and $200 \mu \mathrm{l}$ of Buffer KL to the sample. Vortex vigorously to mix thoroughly.
5. Incubate at $\mathbf{2 0} \sim \mathbf{2 5}{ }^{\circ} \mathrm{C}$ for $\mathbf{5} \mathbf{~ m i n}$.
6. Add $300 \mu$ l of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
7. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for 1 min , and discard the pass-through and reinsert the mini column back into the collection tube.
8. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
9. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
10. Centrifuge at full speed for I min and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.
II. Add $50 \mu \mathrm{I}$ of nuclease-free water to the center of the membrane in the mini column.
Incubate at room temperature for I min.
11. Centrifuge at full speed for I min.

## H. PROTOCOL FOR Dried blood spot

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better).
into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare $1.5 \mathrm{~m} /$ microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer BL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
> * This protocol is suitable for blood, both untreated and treated with anticoagulants, which has been spotted and dried on filter paper (Schleicher and Schuell 903 or any equivalent).
I. Place 3~4 punched-out circles from a dried blood spot into a 1.5 ml microcentrifuge tube and add $\mathbf{2 0 0} \boldsymbol{\mu}$ l of Buffer SL.
Use a $3 \mathrm{~mm}(1 / 8 ")$ single-hole paper puncher to cut out the circles from a dried blood spot.

2. Incubate at $56{ }^{\circ} \mathrm{C}$ for 10 min . Spin down briefly to remove any drops from inside of the lid.
Do not incubate for more than 15 min .
3. Add $20 \mu$ l of Proteinase $K$ solution ( $20 \mathrm{mg} / \mathrm{ml}$, provided) and $200 \mu \mathrm{l}$ of Buffer BL to the sample. Vortex vigorously to mix thoroughly and spin down briefly to remove any drops from inside of lid.
Use Buffer BL instead of Buffer KL in the case of blood samples. The Buffer KL can cause blood clotting.
4. Incubate at $56^{\circ} \mathrm{C}$ for 10 min .
5. Transfer the lysate except paper to the $I .5 \mathrm{ml}$ mi microcentrifuge tube.
6. Add $300 \mu \mathrm{I}$ of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
7. Transfer the mixture to the Column Type $P$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for $I \mathrm{~min}$, and discard the pass-through and reinsert the mini column back into the collection tube.
8. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
9. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
10. Centrifuge at full speed for $I \mathrm{~min}$ and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.
II. Add $50 \mu$ I of nuclease-free water to the center of the membrane in the mini column.
Incubate at room temperature for I min.
11. Centrifuge at full speed for I min.

## I. Protocol for <br> Gram positive bacteria

## Before experiment

- Before using for the first time, add absolute ethanol (ACS grade or better). into Buffer RB I, RBW and RNW as indicated on the bottle.
- Prepare 1.5 ml microcentrifuge tube.
- All centrifugation should be performed at room temperature.
- Prepare Proteinase K solution (20 mg/ml) for first use.
- If a precipitate has formed in Buffer KL, heat to dissolve at $56^{\circ} \mathrm{C}$ before use.
- Prepare Enzyme Mixture; Resuspend the appropriate enzyme (not provided, listed below) with Buffer GP (not provided, listed below) just before use. Enzyme mixture should be stored at $-20^{\circ} \mathrm{C}$ (or below) as small aliquots; ideally, once per an aliquot. Thawed aliquot should be discarded.
$30 \mathrm{mg} / \mathrm{ml}$ lysozyme (LYS702, Bioshop, Canada, or equivalent) or/and
$300 \mu \mathrm{~g} / \mathrm{ml}$ lysostaphin (L7386, SIGMA, USA, or equivalent)
Buffer GP (I06-900~106-905, GeneAll, Korea)
* For certain species, such as Staphylococcus, treatment of lysostaphin (final conc. $=$ $300 \mu \mathrm{~g} / \mathrm{ml}$ ) may be required for efficient lysis instead of (or with) lysozyme. However, lysozyme is sufficient to lyse the cell wall for most gram positive bacterial strains.
I. Harvest cells (up to $2 \times 10^{9}$ cells) in a 1.5 ml microcentrifuge tube by centrifugation at full speed for I min. Discard the supernatant.

2. Resuspend the cell pellet thoroughly in $I 80 \mu \mathrm{I}$ of the prepared enzyme mixture. Incubate at $37^{\circ} \mathbf{C}$ for $\mathbf{3 0} \mathbf{~ m i n}$.
The purpose of this treatment is to weaken the cell wall so that efficient cell lysis can take place.
3. Add $\mathbf{2 0 0} \boldsymbol{\mu}$ I of Buffer SL to the sample. Vortex to mix thoroughly.
4. Add $20 \mu \mathrm{I}$ of Proteinase K solution ( $\mathbf{2 0} \mathrm{mg} / \mathrm{ml}$, provided) and $200 \mu \mathrm{l}$ of Buffer KL to the sample. Vortex vigorously to mix thoroughly.
5. Incubate at $\mathbf{2 0} \sim \mathbf{2 5}^{\circ} \mathrm{C}$ for $\mathbf{5} \mathbf{~ m i n}$.
6. Add $300 \mu \mathrm{I}$ of Buffer RBI to the sample, pulse-vortex to mix the sample thoroughly, and spin down briefly to remove any drops from inside of the lid.
7. Transfer the mixture to the Column Type $\mathbf{P}$ (mini) carefully, centrifuge at $10,000 \times \mathrm{g}$ above for 1 min , and discard the pass-through and reinsert the mini column back into the collection tube.
8. Repeat step $\mathbf{7}$ with the remainder of the sample.
9. Add $600 \mu \mathrm{l}$ of Buffer RBW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
10. Add $600 \mu \mathrm{l}$ of Buffer RNW to the mini column, centrifuge at $10,000 \times \mathrm{g}$ above for I min, and discard the pass-through and reinsert the mini column back into the collection tube.
II. Centrifuge at full speed for $I \mathrm{~min}$ and remove residual wash buffer. Place the mini column into a fresh 1.5 ml microcentrifuge tube.
11. Add $50 \mu \mathrm{l}$ of nuclease-free water to the center of the membrane in the mini column. Incubate at room temperature for I min.
12. Centrifuge at full speed for I min.

## Troubleshooting Guide

| Facts | Possible Causes |
| :--- | :--- |
| Low yield | Poor quality of <br> starting material |
|  |  |

Low cells
in the sample

Some samples such as serum/plasma may have low concentration of cells.
To increase the binding efficiency of the nucleic acid, it is recommended to use Carrier RNA. Carrier RNA can be purchased separately (Cat. No. I I 8-962 [270 $\mu \mathrm{g}]$, I I 8~963 [370 $\mu \mathrm{g}]$ ).

## Inefficient or insufficient lysis

For proper lysis, the complete mix of sample and Buffer KL is essential.
Improper elution

Add Nuclease-free water to the center of the mini column membrane and perform incubation for I min before centrifugation.
Precipitation of
Buffer KL and BL

Storage at cool ambient temperature may cause precipitation in Buffer KL and BL. For a good result, any precipitate in the buffer should be dissolved by heating the buffer at $37^{\circ} \mathrm{C}$ or above until it disappears.

## Degradation of RNA

## Column clogging

RNase can be introduced during purification of nucleic acid. Be certain not to introduce any RNases during the procedure or later handling. Keep tubes closed whenever possible during the extraction and use RNase-free products with sterile and disposable plastic ware.

Reduce the amount of starting sample. Especially tissue sample, use the correct amount of starting sample.

| Facts | Possible Causes | Suggestions |
| :---: | :---: | :---: |
|  | PCR inhibitors present in samples | PCR inhibitor in samples such as stool can obstruct PCR reaction. Dilute the elute to use the template for PCR reactions. |
|  | Too high concentration of cells in animal tissues | Tissue samples usually have many cells. The total nucleic acid of cells from animal tissue can be competitors with the nucleic acid of the pathogen in PCR reactions. <br> Dilute the elute to $20 \sim 250 \mathrm{ng}$ to use the template for PCR reactions. |
| Eluate does not perform well In downstream Application | Buffer RBI, RBW, or RNW was prepared incorrectly | Check that the concentrated Buffer RBI, RBW, and RNW were diluted with the correct volume of absolute ethanol. |
|  | Residual ethanol from Buffer RNW remains in elute | Care must be taken for eliminating the carryover of Buffer RNW before elution step. The membrane of mini spin column should be kept completely dry via additional centrifugation or air-drying. |
|  | Use of Buffer RBW and RNW in the wrong order | Ensure that Buffer RBW and RNW are used in the correct order in the protocol. <br> If used in the wrong order, perform the last washing step with RNW. |

## APPENDIX I

## DNase I treatment in eluate

Treatment with DNase I is an optional step to eliminate DNA in eluate depending on purpose of experiment.
Appendix I describes how to use the DNase I (Not included in this kit).
This procedure is more efficient than on-column DNase I treatment.

## Protocol

I. Prepare the mixture as below in a 1.5 ml microcentrifuge tube.

- $50 \mu$ l eluate
- $5 \mu$ I Buffer DRB
- I $\mu$ I DNase I solution (Cat. No. 307-928)

2. Incubate the mixture for $\mathbf{1 0} \mathbf{~ m i n}$ at room temperature.
3. Add I $\mu \mathrm{I} 0.25 \mathrm{M}$ EDTA per $50 \boldsymbol{\mu}$ eluate.
4. Inactivate DNase I enzyme at $\mathbf{7 5 ^ { \circ }} \mathbf{C}$ for $\mathbf{I 0} \mathbf{~ m i n}$.

* For efficient DNase I treatment and clean-up of eluated RNA, use of Riboclear ${ }^{\text {TM }}$ plus (Cat.No. 313-150) is suggested.
- Related product
Product Cat. No. Size Features and Benefits
- Efficient removal of genomic DNA including DNase I

Riboclear ${ }^{\text {TM }}$ plus 313 -150 50 prep

- Stable and consistent yield
- Concentrated RNA eluate using micro column
- Complete removal of salt and enzymes
- No use of organic solvents, no ethanol precipitation

## APPENDIX II

## RNase A treatment in eluate

Treatment with RNase A is an optional step to eliminate RNA in eluate depending on purpose of experiment.
Appendix II describes how to use the RNase A (Not included in this kit).

## Protocol

I. Prepare the mixture as below in a 1.5 ml microcentrifuge tube.

- $50 \mu$ l eluate
- $4 \mu \mathrm{I}$ RNase solution ( $100 \mathrm{mg} / \mathrm{ml}$, Cat. No. I I7-960)

2. Vortex to mix thoroughly.
3. Incubate the mixture for 10 min at $37^{\circ} \mathrm{C}$.

## GeneAll ${ }^{\circledR}$ Protein series

| ProtinEx <br> Animal cell $/$ tissue | 100 ml | $701-001$ | solution |
| :--- | :--- | :--- | :--- | :--- |
| PAGESTA |  |  |  |
| Reducing |  |  |  |
| 5X SDS-PAGE <br> Sample Buffer | $1 \mathrm{ml} \times 10$ tubes | $751-001$ | solution |

GeneAll ${ }^{\circledR} \mathbf{S T E A D} \boldsymbol{i}^{\text {™ }}$ for automatic nucleic acid puritication

| I2 Instrument |  | GSTOI2 | system |
| :--- | :---: | :---: | :---: |
| 24 Instrument |  | GST024 | system |
| Genomic DNA Cell / Tissue | 96 | $401-104$ | kit |
| Genomic DNA Blood | 96 | $402-105$ | kit |
| Total RNA | 96 | $404-304$ | kit |
| Viral DNA / RNA | 96 | $405-322$ | kit |
| Genomic DNA Plant | 96 | $407-117$ | kit |
| Soil DNA | 96 | $408-114$ | kit |

| $\text { GeneAll }{ }^{\oplus} \underset{\text { ADVANCED }}{\text { GENT }}{ }^{\text {TM }} \text { зг }$ | Ultimately flexible automatic extraction system |  |  |
| :---: | :---: | :---: | :---: |
| Automatic extraction equipment |  | GTI032A | system |
| Genomic DNA | 48 | 901-048A | tube |
|  | 96 | 901-096A | plate |
| Viral DNA / RNA | 48 | 902-048A | tube |
|  | 96 | 902-096A | plate |
| Plant DNA / RNA | 48 | 904-048A | tube |
|  | 96 | 904-096A | plate |

| GeneAll ${ }^{\text {® }}$ GENTi ${ }^{\text {TM }}{ }^{\text {з2 }}$ | Ultimately flexible automatic extraction system |  |  |
| :---: | :---: | :---: | :---: |
| Automatic extraction equipment |  | GTI032 | system |
| Genomic DNA | 48 | 901-048 | tube |
|  | 96 | 901-096 | plate |
| Viral DNA / RNA | 48 | 902-048 | tube |
|  | 96 | 902-096 | plate |
| Whole Blood Genomic DNA | 48 | 903-048 | tube |
|  | 96 | 903-096 | plate |
